

## **interfacial adhesion**

Adhesion in which interfaces between phases or components are maintained by intermolecular forces, chain entanglements, or both, across the interfaces.

Notes:

1. Interfacial adhesion is also referred to as tack.
2. Adhesive strength (recommended symbol:  $F_a$ , unit:  $\text{N m}^{-2}$ ) is the force required to separate one condensed phase domain from another at the interface between the two phase domains divided by the area of the interface.
3. Interfacial tension (recommended symbol:  $\gamma$ , unit:  $\text{N m}^{-1}$ ,  $\text{J m}^{-2}$ ) is the change in Gibbs energy per unit change in interfacial area for substances in physical contact.
4. Use of the term interfacial energy for interfacial tension is not recommended.
